Demanding that the total flux of chameleons does not exceed 3% of the solar luminosity leads to the stringent upper limit on the chameleon-photon conformal coupling  $\beta_{\gamma} \lesssim 10^{10}$ , assuming that the height of the chameleon potential is set to the dark energy scale  $\Lambda = 2.4$  meV, and independently of other couplings to matter.

We revisit the flux of chameleons (light scalar particles which could play a role in the dark energy phenomenon) produced in the interior of the Sun. Our novel analysis incorporates various important details and new processes that have previously been overlooked, including the impact of the bulk magnetic field profile, as well as Primakoff production of chameleons in the electric ...
