This strategy reduces energy consumption. A dual-coil relay achieves the same result by using two coils: one to overcome the force of the spring and another for holding. The holding coil uses less power. Economizers and dual-coil relays are designed for relays that will remain in continuous service rather than intermittent duty.

(8), larger direct current is induced in the two HTS coils in the energy storage stage. In contrast, if the distance d between two HTS coils is larger than 30 mm, μ_{p1} and μ_{p2} decrease sharply, and the mutual inductance M decreases slowly. Hence, the currents induced in the two HTS coils during the energy storage stage stay nearly the same.
