Three-phase electrical systems are subject to current imbalance, caused by the presence of single-phase loads with different powers. In addition, the use of photovoltaic solar energy from single-phase inverters increases this problem, because the inverters inject currents of different values, which depend on the generation capacity at a given location.

proposed for the PV systems that allow the continuation of energy supply to loads during a fault using a redundant shared-bus. At the device level, a topology for the inverter that is tolerant of faults on semiconductor switches of the inverter with the utility for the PV systems has been proposed. The PV inverters theoretically can be developed as reactive power supporters, the same as the static compensators (STATCOMs) that the industrial standards do not address. Typical PV inverters are designed to be disconnected at night. Alternatively, it is possible to use its reactive power capability when there is no active power generation.
